

Will The New iPhone 7 Be a Successful Productivity Tool?

Mobile phone has changed our lives. Having a mobile phone today means that you have an easy access to your documents, photos, meetings and everything in your pocket. You can get many tools in your mobile phone so that your work becomes easy and more conveniently. As we all know in the past, the launch of all Apple's iPhone models has created a large market share for the company, which brings us to the new iPhone 7 release in 2016 (although some say it can still be released in the coming months) . There are many gossips and rumors about this new phone.

The new mobile device will be the decider but it seems there are many good and advanced features in the upcoming iPhone 7, which will for sure dictate its popularity and reliability. Some of the amazing features of this handset are given below:

SCREEN SIZE OF THE IPHONE 7

As we have seen previously in the iPhone 6, the screen size was quite large as compared to the previous versions. The size of iPhone 6 was 4.7 inches which was quite easy to use and people were very attracted by this feature. The new iPhone 7 will have a bigger screen size which will increase the productivity as you will be able to do more work on a screen bigger than ever before.

WILL BATTERY CAPACITY BE ITS WEAKNESS?

The previous iPhone versions were not very good regarding battery life (as compared to Samsung Galaxy series) but apparently the company won't compromise design over an extended battery life. However, some rumors point out that Apple's newest device will presumably have 3000 maH battery which will increase standby time as well as the overall usage time. The iPhone 7 customer will be able to play games for a longer period of time, listen to its favorite music and do some work more efficiently on the go.

LASER KEYBOARD FEATURE

It is also expected that the iPhone 7 will have a laser keyboard and – if this is correct – it will create a big advantage for the typical business man because the new device will increase the productivity as everyone can type as quick as possible with a bigger keyboard attached to a sapphire crystal display device. With the iPhone 7 Apple's trying to combine mobile productiveness with ease of use.

In conclusion – although nothing is confirmed by Apple yet – we can see a clear difference between iPhone 7 and all other handsets. The new iPhone 7, while trying to maintain design and its distinctive silhouette, will also be aimed at those who are looking to increase mobile productivity and performance. With some new features such as the new camera, wider screen, bigger battery capacity, laser keyboard and more storage space, the new iPhone will increase its overall performance and will – for sure – be the perfect ally to all of those that seek on Apple's devices the ultimate mobile working tool.
